What you're building

An AI receptionist for a small dog grooming shop called Maple Street Dog Grooming. The shop gets around 30 calls a day. People want to book a grooming appointment, change an appointment, ask about pricing or hours, complain about a charge, ask about vaccination requirements, ask if you groom a certain breed, or call to say they're running late. The agent picks up. You decide what it handles and what gets handed off to a human.

It talks to two things:

- Google Calendar, where it checks availability and creates or changes events.
- Google Sheets, where it keeps a row per caller and logs what came up on each call.

Phase 1 is a text chat. Phase 2 makes it a voice agent on Vapi.

Stack

TypeScript or Python. Any LLM provider.

Phase 1: build the agent

We only care about correctness here. Speed, token cost, and UI polish don't matter.

Build the agent and put a basic chat UI on top so we can talk to it. UI gets no points. Don't waste time on it.

For setup, put a few events on the Calendar in advance so you can test conflicts and reschedules. Make a Google Sheet with a Contacts tab. Columns are up to you.

A conversation might go something like:

Caller: Is the 3:30 bath and trim appointment on Thursday open? Agent: That one's full. The 4:30 appointment is open, want that instead? Caller: Sure, 4:30 works. Agent: Got it. Can I get your name and a number to reach you on? Caller: Sara, 415-555-0190. Agent: Booked you in. Anything else?

Phase 2: voice with Vapi

Wire the Phase 1 agent into Vapi. It should sound like a real person. If there's more than about 1.2 seconds between someone speaking and the agent replying, it sounds like a bot. Vapi has a lot of knobs. Tune them.

Same conversation, on a call:

Caller: Hey, can I book the 3:30 bath and trim Thursday? Agent: Let me check... that one's full. 4:30 has space, want that? Caller: Yeah okay. Agent: Cool. Name and number? Caller: Sara, four one five five five five oh one ninety. Agent: Got it Sara, you're in for 4:30 Thursday. Anything else?

Submission

- GitHub repo (add reviewers if private).
- A short video of the Phase 1 chat. Calendar and Sheet should match what's on screen.
- A short video of a real call with the Phase 2 Vapi assistant.
